Replace manual lubrication with automatic lubricators and reduce your total cost

Improved performance

A continuous and accurate supply of fresh, clean lubricant prevents overheating, waste and seal damage due to over-lubrication, and excessive wear due to under-lubrication.

Reliability

Minimises risks such as cross contamination, inadequate quantities/frequencies, or simply overlooking a lubrication point.

Labour saving

Resources can be dedicated to more valuable value-added activities such as oil analysis or contamination control.

Safety

Some re-lubrication tasks pose safety risks, or a machine has to be stopped to be lubricated.

Environmental

Optimising lubricant consumption minimises the impact on the environment.

Total cost of ownership

The largest savings are usually related to reducing downtime, machine repair costs, labour and lubricant consumption.
